

Architect

LESSON 04 · OVERVIEW — LYZR OVERVIEW & OFFERINGS

What you'll learn

- Understand the role of Lyzr Architect as a whiteboard planning and design engine.
- Discover how Architect automatically generates project specs, UI layouts, and agent flows.
- Learn how to transition from an approved visual plan to active agents in Lyzr Studio.

Key concepts

Lyzr Architect is the most sophisticated layer for visual planning.

Users can whiteboard their application concept, sketching out how they want the system to behave.

Architect automatically drafts detailed system documents and UI blueprints. It specifies the interface layout, the backend agents, and the flow of communication between different subagents.

An approved Architect plan compiles directly into active agents in Studio. Once you proceed with the generated blueprint, the platform provisions the corresponding agents and outputs a functional front-end out-of-the-box.

TAKEAWAY

Lyzr Architect is the most sophisticated layer for visual planning.

TAKEAWAY

Architect automatically drafts detailed system documents and UI blueprints.

TAKEAWAY

An approved Architect plan compiles directly into active agents in Studio.

In Studio

- Open the Architect workspace to view the visual layout designer and document generator.
- Walk through the flow of accepting an Architect plan and verifying the newly generated agents in Studio.

TRY THIS

- 1** Design a simple agent workflow in a whiteboard-like layout, specifying the user interface elements and backend agents needed.
- 2** Generate a plan using Architect and verify how the agent definitions are populated in the Studio dashboard.
