

Computer Agent

LESSON 07 · OVERVIEW — LYZR OVERVIEW & OFFERINGS

What you'll learn

- Understand the concept and capabilities of Lyzr Computer Agent.
- Learn how to bring your own agent code, harness, and runtime environments.
- Discover how Computer Agent routes output to external communication channels.

Key concepts

Computer Agent allows you to run custom agent code from Git repositories. You can host your agent files on GitHub or GitLab and import them directly into the Lyzr harness.

Users retain complete control over the harness, runtime, and memory. Instead of relying on hosted cloud sandboxes, you specify exactly where the agent runs and how its conversations are persisted.

Output can be routed seamlessly to any enterprise communication channel. The agent can write directly to Slack, Teams, email, or custom webhooks once execution finishes in your runtime.

TAKEAWAY

Computer Agent allows you to run custom agent code from Git repositories.

TAKEAWAY

Users retain complete control over the harness, runtime, and memory.

TAKEAWAY

Output can be routed seamlessly to any enterprise communication channel.

In Studio

- Review the Computer Agent architecture slides showing Git repository links, runtime environments, and channel integrations.
- Walk through the setup of a custom execution harness.

TRY THIS

- 1** Identify a Git repository containing an agent script and plan how you would connect its runtime to Computer Agent.
- 2** Map out a communication flow where a Computer Agent reads data from a runtime and posts an alert to a Slack channel.
