

# Designing Knowledge Bases & Source Selection

Lesson 02 · Studio: Grounding Agents in Knowledge · Lyzr University

## What you'll learn

---

- How to create a Knowledge Base in Lyzr Studio
- Selecting vector stores and embedding models for your domain
- Comparing input source types: Files, Web Crawlers, Text, and Live Data Sources
- Setting up auto-resync intervals for Google Drive & SharePoint live sources

## Key Concepts

---

### Creating the Base

Navigate to Knowledge Base in Studio -> New Knowledge Base. Choose vector store and embedding model defaults or custom connections.

### Input Sources

Support for PDF, DOCX, TXT files, website crawlers, raw text, and live drive connectors.

### Live Data Sync

Use Live Sources when data updates at the origin. Set periodic recrawl intervals so embeddings auto-refresh.

## Code & Workflow Reference

---

```
# Studio API equivalent for Knowledge Base Creation
kb = studio.create_knowledge_base(
    name="Nova Bridge Employee Policies",
    description="Knowledge base containing employee policies for Nova Bridge Technologies",
    vector_store="default",
    embedding_model="default"
)

# Adding file and live web sources
kb.add_file("nova_bridge_handbook.pdf")
kb.add_live_source(type="website", url="https://novabridge.tech/policies", resync_interval="24h")
```
