

Wiring KB to Agent & Debugging Execution Traces

Lesson 05 · Studio: Grounding Agents in Knowledge · Lyzr University

What you'll learn

- Connecting a Knowledge Base to a Studio Agent
- Auto-generating detailed agent roles & instructions using AI Improve
- Enforcing strict refusal prompts ('If not in KB, state that you do not know')
- Inspecting live execution activity traces in the Studio Playground

Key Concepts

AI Prompt Refinement

Use the 'Improve' feature in Studio to turn simple goals into comprehensive system prompts.

Strict Refusal Guardrails

Explicitly instruct the model to ground answers solely in the KB to eliminate hallucinations.

Execution Traces

The right-hand Activity drawer shows real-time chunk retrieval, similarity scores, and memory persistence.

Code & Workflow Reference

```
agent = studio.create_agent(  
    name="Employee Policy Agent",  
    role="Expert employee policy specialist",  
    instructions="Consult designated knowledge base. If answer is not present, state 'I do not know'.",  
    model="gpt-4o",  
    knowledge_bases=[kb]  
)  
  
response = agent.run("What is the compensation for a software engineer with 5 years experience?")  
# Output: "I do not know the answer to your query." (Strict refusal working as expected)
```
