

Deploy — ship it

LESSON 06 · FOUNDATIONS · THE AGENT LIFECYCLE

What you'll learn

- Find your agent's ready-made API on the Deploy tab — it's been live since creation, with nothing to spin up
- Choose between two ways to put an agent in front of people: an API embed for developers, or a published App Store app you ship straight from Studio
- Publish your support agent to the Lyzr App Store under the right category and get a shareable app
- Recognise the build-govern-test-deploy loop as complete, with only monitoring left to close it

Key concepts

Your agent was live behind an API the moment you created it — there is no deploy step. This is the surprise of the lesson. Building the agent in Studio already exposed it as a callable endpoint; the Deploy tab just shows you it's "deployed and ready to use." Shipping isn't an action you perform on the agent, it's a decision about how you put it in front of people.

There are two distribution paths, and you pick based on your audience. If you have developers, the Deploy tab hands you a ready-made API you drop straight into a website or app. If you'd rather not touch code, you publish the agent to the Lyzr App Store right from Studio, where it becomes its own shareable app. Same agent, two front doors.

Publishing to the App Store means picking a category, not writing config. In the launch configuration you choose the category that fits the agent — for a support agent, customer experience is the right home — then hit Publish. That single choice in the Studio UI is what makes it discoverable and shareable as an app.

Five lessons in, the lifecycle loop is almost closed. You went from a blank page to a governed, tested, and published agent in a few minutes: build, equip, govern, test, deploy. The only open question is how the agent behaves once real people start using it — which is exactly what monitoring and traces answer next.

In Studio

Studio feature: **Deploy · Lyzr App Store.**

1. Open the **Deploy** tab for your support agent. It already reads as deployed and ready to use — confirmation the agent has been live behind an API since creation.

TAKEAWAY

Your agent was live behind an API the moment you created it — there is no deploy step.

TAKEAWAY

There are two distribution paths, and you pick based on your audience.

TAKEAWAY

Publishing to the App Store means picking a category, not writing config.

TAKEAWAY

Five lessons in, the lifecycle loop is almost closed.

2. Note the **ready-made API** shown here. This is the endpoint a developer would drop into a website or app; no extra deploy step is needed to make it work.
3. To ship it as a standalone app instead, click **Publish**.
4. In the **launch configuration**, choose a **category**. Since this is a support agent, pick **Customer Experience**.
5. Hit **Publish**. The agent is now published — live and shareable as its own app in the Lyzr App Store, all from the Studio UI.

TRY THIS

- 1** Open the Deploy tab on your support agent and *locate the ready-made API* before you publish anything — confirm for yourself that the agent was already live, with nothing for you to start.
- 2** Publish the agent to the Lyzr App Store under the **Customer Experience** category, then open the resulting app and send it one in-doc question (e.g. *the return window for an unopened laptop*) to confirm the published app behaves the same as the Playground did.
- 3** *Optional:* publish a second throwaway agent under a different category and notice how the category choice changes where it lands in the App Store — this is the only knob that controls discoverability.
